

**GLOBE
CONTROL VALVE**

GLE®

INTRODUCTION

The GLĒ Series Control Valve is an advanced and reliable alternative for application in severe services where conventional control valves would last only few weeks.

Developed specifically for applications in erosive, corrosive or severe flashing flow conditions, the GLĒ valve design incorporates innovative solutions that make this valve the optimum choice to overcome challenges presented under such conditions of use.

In the case of corrosive applications, the broad option of construction materials, ranging from stainless steel to titanium, practically assures compliance with the requirements of any industrial processes, while for applications with erosive, abrasive or flashing condition fluids, this valve presents a precise design, with an hydrodynamic internal geometry, that helps the flow of slurries, dirty fluids or fluids that present high concentrations of suspended solids.

The modern design incorporates technology resources that considerably extend the service life and the maintenance intervals for the GLĒ Series, when compared to conventional control valves: the angle body has a sweep internal curve and a significantly greater gallery, larger than traditional angle valves, that minimizes wear caused by aggressive fluids or fluids flowing at high velocities. The bonnet bottom configuration significantly helps the flow of slime and scale-forming fluids

The GLĒ valve seat is fitted and fixed by a flange system that: does not require the use of retainers and the guide system in the seat retainer; offers less flow restriction; prevents creating pockets where the fluid gets trapped, and; facilitates maintenance. According to the level of requirements for each specific application, the valve trim can be manufactured with several metallic alloys that withstand wearing out or even made using ceramic material, and there is also the possibility of using extended ventury-type seats, that pass through the body outlet.

Sharing many design solutions already proven in the well known Valtek Sulamericana GLS valves, such as: top entry assembly; double upper guide system on the plug stem, and; spring-cylinder actuators, with high actuation thrust and accurate positioning, the GLĒ Series present reliable operation and low maintenance cost, being the Best choice for applications in extremely severe processes.

GLĒ SERIES – BODY SUB-ASSEMBLY (FIGURE 1)

Rangeability 30:1 (Typical)

ANSI Class II Shutoff – Ceramic Trim*
ANSI Class IV Shutoff – Metal Trim*

* The GLĒ valve is available only with unbalanced trim.

CONVENTIONAL ANGLE BODY (FIGURE 2)

ANGLE BODY WITH SWEEP ANGLE AND OVERSIZED GALLERY OF THE GLĒ SERIES (FIGURE 3)

SEAT FIXATION SYSTEM (FIGURE 4)

Reliability

The exclusive design of the GLĒ Series angle valve, with its sweep angle and oversized gallery, presents by itself, significant advantages regarding applications with erosive, abrasive or flashing fluids: while the sweep angle of the body provides a more orderly flow, preventing turbulences caused by sharp corners and the sudden change of flow direction, which is specially desired when handling erosive fluids, the body oversized gallery, with large dimensions, provides a reduction of the flow velocity just on more sensitive points of an angle valve, that is, in the region where the fluid changes its direction and in the areas around the choking point. In applications with flashing fluids, the geometry of the valve ensures that the energy dissipated under these conditions of flow is directed far from the critical components.

In addition to these characteristics, the GLĒ Series present also intelligent solutions for handling difficult fluids that cause excessive wear, such as: the hydrody-

namic body, which does not present sharp turns or stagnant points, preventing the buildup of scale-forming materials; seat system fixed by spool or by the pipeline, which eliminated the need for traditional seat retainers, reducing turbulences and increasing flow coefficients, plus the possibility to use extended venturi-type seats to protect the body and discharge vessel entries against the action of slurries in severe applications or from premature wear caused by high velocities. The exclusive bonnet design, with an extra-deep packing box, enables the assembly of all packing options and has a wiper set that removes impurities carried by the plug stem, contributing to a longer service life of all bonnet internal components.

By putting together such advanced characteristics in a single product, Valtek Sulamericana offers to the market the most modern control valve technology for erosive or corrosive applications.

GLE OVERVIEW / FLOW COEFFICIENTS

GLE SERIES - SPECIFICATIONS & MATERIALS OF CONSTRUCTION (TABLE I)

BODY	Sizes	1 to 18 inches		
	ANSI Ratings	150, 300, 600, 900 & 1500		
	Form	Angle body, with sweep angle and oversized gallery		
	Materials	Carbon steel, stainless steels, Hastelloy, Inconel, titanium and other castable alloys upon request		
	End Connections	Separable Flanges (1 to 4 inches)		
		Integral flanges (all sizes)		
	Separable Flanges	Carbon steel, 316 stainless steel or other materials upon request		
	Gaskets	Flat	PTFE, PTFEG ⁽¹⁾	
		Spiral Wound	316 or 304 spiral wound with graphite, PTFE or other filler materials free of asbestos (AFG)	
		O-Rings	Inconel X-750 / silver plated hollow O-Ring	
BONNET	Types	Standard, extended		
	Materials	Same as body		
	Bonnet Flange	Separable, made from carbon steel or 316 stainless steel		
TRIM	Type	Unbalanced		
	Flow Characteristics	Equal Percentage, Linear		
	Materials	316 SS with Alloy #6 overlay, solid Alloy #6, 316 SS with tungsten carbide, 316 SS with silicon carbide, ceramic		
PNEUMATIC ACTUATOR	Type⁽²⁾	Double-acting cylinder with positive spring for failsafe action. Field reversible.		
	Sizes	25, 50, 100, 200, 300, 400, 500 and 600		
	Options	Manual handwheel, limit stops and others		
POSITIONER	Types	Pneumatic, analog electro-pneumatic or digital electro-pneumatic with multiple communication protocols		

⁽¹⁾ PTFEG: Glass-Filled PTFE. ⁽²⁾ Other type of actuators available upon request.

Ceramic (PSZ)	69	Moderate	Good to Excellent	Excellent	Excellent
Ceramic (Tungsten Carbide)	72	Moderate	Good on Bases, Poor on Acids	Excellent	Excellent

Packing Box

In addition to well-proven characteristics incorporated to other linear valves developed by Valtek Sulamericana, such as the double upper guide system, with oversized plug stem and guides widely spaced and upper packing set not wetted by the process fluid, the GLĒ valve packing box present also two special features that makes it the ideal choice for using with scale-forming or slurry fluids:

1. Wiper rings, that prevents scales from reaching the packing box and damages to the packing, and;
2. Purge connection, which may be used for detection of emissions or for pressurizing the packing box, providing additional protection to the assembly.

GLĒ SERIES – STANDARD BONNET (FIGURE 7)

BONNETS (TABLE IV)		
BONNET TYPE	TEMPERATURE LIMITS	
	°F	°C
Standard	-20 to 750	-28 to 400
Extended	-150 to 1500	-100 to 815

GUIDES & WIPER RINGS (TABLE V)	
ITEM	MATERIALS
Guides	316 SS with PTFEG or graphite inserts, solid guides manufactured with bronze or Alloy #6
Wiper Rings	Alloy #6, PSZ, Inconel

Graphite/AFP ⁽³⁾	-20 to 750	-28 to 400	-20 to 1200	-28 to 650
Graphite/AFP ⁽³⁾ , Inconel wire	-20 to 750 ⁽⁴⁾	-28 to 400 ⁽⁴⁾	-20 to 1200	-28 to 650
Graphite ⁽⁵⁾	-20 to 750 ⁽⁴⁾	-28 to 400 ⁽⁴⁾	-20 to 1500	-28 to 815

⁽¹⁾ ANSI B16.34 specifies acceptable pressure and temperature limits for pressure retaining materials. Contact manufacturer for additional information about the pressure vs. temperature limits of packings. ⁽²⁾ Temperature limits are valid provided that pressure vs. temperature limits of body, bonnet and remaining parts are respected. ⁽³⁾ High temperature packing, free of asbestos. ⁽⁴⁾ For sizes from 8 to 12 inches, the maximum temperature limit is 850°F (454°C). ⁽⁵⁾ Do not use graphite packing in oxidizing services such as air or oxygen with operating temperatures higher than 800°F (426°C). Due to the increased friction, the use of graphite packing may require the use of extra-strong springs and/or oversized actuators.
