

ECCENTRIC PLUG CONTROL VALVE

INTRODUCTION

Rotary control valves are being used more and more due to their large flow capacity, high rangeability, compact sizes, superior shaft sealing capacity and a broad range of applications meaning the solution for several industrial process control.

The EXL[®] eccentric plug control valve was developed as a simple, lightweight and more economical alternative to the renowned and advanced design of Valtek Sulamericana eccentric plug control valve model EP.

The $E\overline{xL}^{(R)}$ control valve was designed to handle differential pressures up to 725 psi (50 Bar), temperature range from -150 to 752°F (-100 to 400°C) and is available in sizes from 1 to 8 inches with ANSI classes 150 – 300 or DIN PN 16 – 40.

Its eccentric plug provides rangeability over 160:1, considered excellent when compared to the 30:1 rangeability of globe valves and 20:1 of the majority of butterfly valves.

For each valve size, several reduced trim are also available. Thanks to these trim options, it is possible to obtain a broad range of nominal Cv's, allowing on several applications, an accurate and refined control of the fluid through the valve.

Rangeability higher than 160:1

ANSI Class IV Shutoff — Metal Seat ANSI Class VI Shutoff — Soft Seat

VALVE OPEN (FIGURE 2)

STATIONARY POST (FIGURE 3)

Equipped with a rugged and non-crossover shaft, which does not restrict the fluid flow, the EXL[®] valve provides higher capacity for each nominal size. Its advanced construction eliminates damages caused by corrosive/abrasive process fluids.

In most traditional rotary valves, the shaft usually passes through the valve body causing significant reduction of flow capacity and increasing shaft wear. The EXL® valve configuration ensures a high flow capacity. While in the open position, the streamlined flow passageway suffers no interference, since the plug is totally retracted into the body core.

When the plug moves to the closed position, its double eccentricity feature makes it turn into the seat at a tilting angle that eliminates metal-to-metal sliding contact (fig. 2). It also eliminates the wear that would require frequent maintenance, consequently reducing operating costs.

As the valve opens and the plug slides smoothly off the seat, the occurrence chances of water hammer effect are drastically reduced. Due to its "zero breakout torque" feature, the $E\overline{XL}^{\mathbb{R}}$ allows the use of smaller actu-

ators, significantly reducing maintenance time and costs.

Since the shaft-plug does not cause flow restriction, the $E\overline{XL}^{\textcircled{R}}$ provides higher flow coefficient (Cv) than any other rotary plug control valve existing in the market.

The combination of a large and rugged stationary post (Fig. 3) with the oversized plug and shaft made from hardened 17-4PH as standard material provide excellent shutoff features and increase trim lifetime.

These characteristics combined with the use of: springcylinder actuators with proven lifetime longer than a million of cycles; HPP1500 Analog or HPP3000 and HPP3500 Digital Positioners, which provide and accurate and refined process control; Packing boxes with large depth that meet the EPA* requirements; Shaft with anti-blowout system that complies with ANSI B16.34; Trim with full area or reduced to 70% or 40% of area able to control a wide range of flow rates, make the EXL one of the most modern, advanced and accurate eccentric rotary plug valve in the world market. *EPA = U. S. Environmental Protection Agency

High parts interchangeability – Reduces the need for spare parts

Lightweight and compact design -Helps handling and needs limited space

Actuators

The RA-XL spring-cylinder rotary actuator combines high torque and pneumatic stiffness with an excellent controllability. These characteristics are integrated into a single, rugged, lightweight and compact assembly, which makes it the ideal choice for rotary valves driving.

The RA-XL double acting spring-cylinder actuator is designed to operate with air supply pressures up to 150 psi (10.3 Bar), reaching high operating torques. The actuator Series RA-XL has a proven lifetime longer than a million of cycles, which makes it the most reliable actuator in the market. The double acting positioner feeds both cylinder chambers simultaneously, ensuring an exceptional stiffness. This pneumatic stiffness makes the actuator Series RA-XL insuperable when an accurate control of the valve positioning is required, even when the valve is operating at small openings.

These features enable a much better performance of the actuator Series RA-XL when compared with the spring-diaphragm actuators.

Positioners

FOR THROTTLING APPLICATIONS, THE RO-TARY ACTUATORS SERIES RA-XL ALLOW THE USE OF SEVERAL POSITIONER OPTIONS.

DIGITAL HPP3500 SERIES (FIGURE 5)

This positioner has the same characteristics of HPP3000, 4-20 mAcc input signal and HART[®] protocol. This project was developed to make easier the positioner installation on rotary actuators with NAMUR interface. Intrinsically safe, this positioner is provided with NEMA 4X and IEC IP66 enclosure and can handle air supply pressures from 20 to 100 psig (1.4 to 6.9 Bar) at operating temperatures from – 40 to 176°F (-40 - 80°C).

DIGITAL HPP3000 SERIES (FIGURE 6)

This is a high performance microprocessed positioner, compatible with HART[®], DE and Fieldbus communication protocols or 4-20 mAcc analog signal, also programmable for several split range configuration. This positioner Series incorporates totally programmable functions such as: auto-tunning, manual and automatic modes, multiple communication protocols and diagnostic information, which contribute to increase productivity and efficiency of industrial plant operations and to lower maintenance. The digital positioner Series HPP3000 can handle air supply pressures from 20 to 100 psig (1.4 to 6.9 Bar) at operating temperatures from – 40 to 176°F (-40 to 80°C).

ANALOG HPP1500 SERIES (FIGURE 7)

This is a single or double acting high performance positioner. It allows the use of a pneumatic module for pneumatic input signals or an analog electro-pneumatic module for control signals in milliamps. Highly resistant and using the state-of-the-art technology, it works with air supply pressures up to 150 psig (10.3 Bar) without requiring air pressure regulators and withstands ambient temperatures from -40 to 176° F (-40 to 80° C). The positioner Series HPP1500 allows two or three split-range configurations with the use of a specific cam.

High performance

Equipped with rugged and oversized shaft and stationary post, positioned by bearings with a broad support surfaces, the design of $E\overline{XL}^{(R)}$ shaft/bearing system provides remarkable wear reduction and considerably extends the valve lifetime.

The standard material for the valve plug is the stainless steel 17-4PH hardened by heat treatment. However, the trim (plug and seat) can be made also from Alloy #6, providing excellent shutoff features and extending the valve use to a wide range of applications such as, flashing process liquids, erosive services, mild cavitations and steam service.

The EXL[®] non-crossover shaft design prevents obstructions in the line, assuring a full flow passageway. When the valve is open, the fluid is not deviated towards the seat or the seat retainer, allowing great reliability even after many years in service.

The plug and driving shaft assembly is done by means of a precise splined connection, which eliminates the use of keys and pins that may be destroyed and lost due to corrosion or vibration effects. The sturdiness of the rigid and extra-strong seat makes the valve performance excellent for applications with high pressure drops. The typical maintenance cycle for the EXL[®] exceeds a 5-year period and its lifetime expectation exceeds a 20-years period.

| BODY SPECIFICATIONS (TABLE III) | | | | | | |
|--|---|--|--|--|--|--|
| Sizes (inches) | 1; 1.5; 2; 3; 4; 6; 8 | | | | | |

| Face-to-Face Dimension | ANSI/ISA-75.08.02 | | | | | |
| Trim Area | ■ 100% Full Area ■ 70% Reduced Area ■ 40% Reduced Area (1 to 6 in.) | | | | | |
| Shutoff | ■ ANSI Class IV with metal seat ■ ANSI Class VI with soft seat | | | | | |
| Operating Temperature | -150 to 752°F (-100 to 400°C) | | | | | |

Additional Advantages

After evaluating the $E\overline{XL}^{\mathbb{R}}$ from the reliability point of view, other considerations shall be taken into account regarding its performance such as: Flow capacity up to 70% larger when compared to eccentric rotary plug valves from other manufacturers; Can be used on pulp and paper processes with consistency up to 3% due to its design with a non-crossover shaft; In closed position, its design allow pressure drops up to 725 psi (50 Bar); the valve can be mounted either with shaft upstream or downstream: Reduced trim with 70 or 40% of area: Shutoff ANSI class IV with metal seats or class VI with soft seats; Shaft with anti-blowout system which eliminates the risk of personnel injuries, fire and process shutdown; Fixed stationary post, which is not damaged by process fluid; 90° plug rotation allowed by using high performance double acting actuator with spring return for failsafe position.

| FLOW DIRECTION (TABLE IV) | | | | | | | |
|---------------------------|--|--|--|--|--|--|--|
| ASSEMBLY | FLOW DIRECTION | APPLICATION | | | | | |
| Standard – right side | Shaft downstream Fluid towards the plug convex face | Clean Fluids Fluids with no cavitation and nor flashing | | | | | |
| Standard – left side | Shaft upstream Fluid towards the plug back face | Fluids with solid particles, abrasive, flashing or cavitating fluids. | | | | | |

PACKINGS

THE EXL® PACKING BOX HAS A LARGE DEPTH AND AN EXCELLENT FINISH OF INTERNAL SURFACES, WHICH PROVI-DES A LONGER OPERATING LIFE FOR THE WHOLE PACKING SET. DUE TO ITS DESIGN CHARACTERISTICS, THE EXL® PACKING BOX ALLOWS THE USE OF A LARGE VARIETY OF PACKING SYSTEMS FOR A BETTER COMPLIANCE WITH THE MOST STRINGENT STANDARDS CONCERNING FUGITIVE EMISSION CONTROL IN MODERN INDUSTRIAL PROCESSES.

STANDARD PACKING (FIGURE 8)

The standard packing of EXL[®] valves is comprised by PTFE "V" Rings. The PTFE "V" Rings have been the most largely used packing material for many years, with excellent tightness results. Its low friction characteristics, good mechanical strength and excellent corrosion resistance make it the most commonly used material for stem and shaft sealing. The PTFE "V" rings are used in the EXL[®] valve with operating temperatures from -150 to 450°F (-100 to 232°C).

HIGH TEMPERATURE PACKING (FIGURE 9)

The $E\overline{xL}^{(R)}$ packing with molded rings is an option when the operating temperature exceeds the limits of PTFE "V" rings. The materials used for $E\overline{xL}^{(R)}$ molded packings are braided PTFE for operating temperatures up to 500°F (260°C) and graphite for operating temperatures up to 752°F (400°C). The graphite molded rings packing is an excellent solution for high temperature applications. However, the high force required for its sealing causes a considerably friction increase in the valve rotation.

SPECIAL PACKINGS (FIGURE 10)

The PT packing type is comprised by a "V" rings set, uniformly and constantly compressed by a mechanical device which includes pairs of belleville washers that acts as springs and provides a "live load" effect. This system reaches a tightness level below 500 ppm. The PT packing type combines the superior quality of virgin PTFE rings with carbon filled PTFE rings. The PTG packing type is comprised by an advanced set of rings able to maintain levels of emission much lower than 500 ppm (usually 10 ppm). The PTG packing combines carbon filled PTFE "V" rings with Kalrez "V" rings, an advanced material which provides a superior packing performance. The PTG XT packing type is used for higher temperatures, up to 550°F (288°C). It uses Zymax "V" rings replacing the carbon filled PTFE rings.

* Except O2

Influence of pipe size in flow coefficient

The nominal Cv values shown in Tables XVI and XVII are for assemblies where the valve, upstream and downstream piping have the same size. When the valve is concentrically installed in piping larger than the valve size, the Cv is affected and must be multiplied by the "FCT" factor according to table XV.

| | C _V CORRECTION FACTOR (TABLE XV) | | | | | | | | | | | | | |
|-----------|---|------|------|------|------|------|---|--|--|--|--|--|--|--|
| TRIM AREA | FCT CORRECTION FACTOR = d/D* | | | | | | | | | | | | | |
| % | 0.4 | 0.5 | 0.6 | 0.7 | 0.8 | 0.9 | 1 | | | | | | | |
| 100 | | | 0.91 | 0.94 | 0.97 | 0.99 | 1 | | | | | | | |
| 70 | 0.93 | 0.94 | 0.96 | 0.97 | 0.98 | 0.99 | 1 | | | | | | | |
| 40 | 0.98 | 0.98 | 0.99 | 0.99 | 0.99 | 0.99 | 1 | | | | | | | |

d = valve nominal size. D = larger piping size, upstream and downstream
